**Pybooru** is a Python package to access to the API of Danbooru/Moebooru based sites.

- Version: **4.2.2**
- Licensed under: [MIT License](#)
- Python:  $\geq 2.7$  or Python:  $\geq 3.3$

---

**Note:** Pybooru 4.2.2 Is the last version that support Python 2.7

---

- requests

## 1.1 Quick Start Guide

### 1.1.1 Features

- Support Danbooru API (version: 2.105.0 - 77e06b6).
- Support Moebooru API (version: 1.13.0+update.3).
- Default site list.
- JSON responses.
- Custom user-agent.

### 1.1.2 Installation

You can download and install Pybooru from [Pypi](#)

```
pip install --user Pybooru
```

### 1.1.3 Install from source

```
git clone git://github.com/luquedaniel/pybooru.git
cd pybooru
pip install --user -r requirements.txt
sudo python setup.py build
python setup.py install
```

### 1.1.4 Example of use with Danbooru

```
from pybooru import Danbooru

client = Danbooru('danbooru')
artists = client.artist_list('ma')

for artist in artists:
    print("Name: {}".format(artist['name']))
```

login (only for functions that **requires login**):

You can pass two parameters to authenticate: “username” and “api\_key”. You can see your API key in your profile.

Example:

```
from pybooru import Danbooru

client = Danbooru('danbooru', username='your-username', api_key='your-apikey')
client.comment_create(post_id=id, body='Comment content')
```

### 1.1.5 Example of use with Moebooru

```
from pybooru import Moebooru

client = Moebooru('konachan')
artists = client.artist_list(name='ma')

for artist in artists:
    print("Name: {}".format(artist['name']))
```

Some functions may require you to authenticate:

- **username**: your site username.
- **password**: your password in plain text.
- **hash\_string** (requires only for sites that isn’t in default site list): a string to be hashed with your password.

Example using default sites:

```
from pybooru import Moebooru

client = Moebooru('konachan', username='your-username', password='your-password')
client.comment_create(post_id=id, comment_body='Comment content')
```

Example using not default sites:

```
from pybooru import Moebooru

client = Moebooru('konachan.com', username='your-username', password='your-password',
                 hash_string='So-I-Heard-You-Like-Mupkids-?--{}--')
client.comment_create(post_id=id, comment_body='Comment content')
```

See more examples of [Danbooru](#) and [Moebooru](#).

### 1.1.6 Default sites list

Pybooru has a list of default sites that allow you to use Pybooru without “site\_url” argument:

- konachan (Konachan)
- yandere (Yande.re)
- danbooru (Danbooru)
- safebooru (Safebooru)
- lolibooru (Lolibooru)

## 1.2 Danbooru Reference

pybooru.danbooru

This module contains Danbooru class for access to API calls, authentication, build url and return JSON response.

**Classes:** Danbooru – Danbooru main classes.

**class** pybooru.danbooru.**Danbooru** (*site\_name=""*, *site\_url=""*, *username=""*, *api\_key=""*)

Bases: *pybooru.pybooru.\_Pybooru*, *pybooru.api\_danbooru.DanbooruApi\_Mixin*

Danbooru class (inherits: Pybooru and DanbooruApi\_Mixin).

To initialize Pybooru, you need to specify one of these two parameters: ‘site\_name’ or ‘site\_url’. If you specify ‘site\_name’, Pybooru checks whether there is in the list of default sites (You can get list of sites in the ‘resources’ module).

To specify a site that isn’t in list of default sites, you need use ‘site\_url’ parameter and specify url.

Some actions may require you to log in. always specify two parameters to log in: ‘username’ and ‘api\_key’.

**site\_name**

Get or set site name set.

**Type** str

**site\_url**

Get or set the URL of Moebooru/Danbooru based site.

**Type** str

**username**

Return user name.

**Type** str

**api\_key**

Return API key.

**Type** str

**last\_call**

Return last call.

**Type** dict

**\_\_init\_\_** (*site\_name=""*, *site\_url=""*, *username=""*, *api\_key=""*)

Initialize Danbooru.

**Keyword Arguments**

- **site\_name** (*str*) – Get or set site name set.
- **site\_url** (*str*) – Get or set the URL of Moebooru/Danbooru based site.
- **username** (*str*) – Your username of the site (Required only for functions that modify the content).
- **api\_key** (*str*) – Your api key of the site (Required only for functions that modify the content).

**\_get** (*api\_call*, *params=None*, *method='GET'*, *auth=False*, *file\_=None*)  
Function to preapre API call.

#### Parameters

- **api\_call** (*str*) – API function to be called.
- **params** (*str*) – API function parameters.
- **method** (*str*) – (Default: GET) HTTP method (GET, POST, PUT or DELETE)
- **file** (*file*) – File to upload (only uploads).

**Raise:** PybooruError: When 'username' or 'api\_key' are not set.

## 1.3 Danbooru API Reference

pybooru.api\_danbooru

This module contains all API calls of Danbooru.

**Classes:** DanbooruApi\_Mixin – Contains all API endpoints.

**class** pybooru.api\_danbooru.DanbooruApi\_Mixin  
Bases: object

Contains all Danbooru API calls.

- API Version commit: 9996030
- Doc: [https://danbooru.donmai.us/wiki\\_pages/43568](https://danbooru.donmai.us/wiki_pages/43568)

**post\_list** (*\*\*params*)  
Get a list of posts.

#### Parameters

- **limit** (*int*) – How many posts you want to retrieve. There is a hard limit of 100 posts per request.
- **page** (*int*) – The page number.
- **tags** (*str*) – The tags to search for. Any tag combination that works on the web site will work here. This includes all the meta-tags.
- **md5** (*str*) – The md5 of the image to search for.
- **random** (*bool*) – Can be: True, False.
- **raw** (*bool*) – When this parameter is set the tags parameter will not be parsed for aliased tags, metatags or multiple tags, and will instead be parsed as a single literal tag.

**post\_show** (*post\_id*)  
Get a post.

**Parameters** `post_id (int)` – Where `post_id` is the post id.

`post_update (post_id, tag_string=None, rating=None, source=None, parent_id=None, has_embedded_notes=None, is_rating_locked=None, is_note_locked=None, is_status_locked=None)`

Update a specific post (Requires login).

**Parameters**

- `post_id (int)` – The id number of the post to update.
- `tag_string (str)` – A space delimited list of tags.
- `rating (str)` – The rating for the post. Can be: safe, questionable, or explicit.
- `source (str)` – If this is a URL, Danbooru will download the file.
- `parent_id (int)` – The ID of the parent post.
- `has_embedded_notes (int)` – Can be 1, 0.
- `is_rating_locked (int)` – Can be: 0, 1 (Builder+ only).
- `is_note_locked (int)` – Can be: 0, 1 (Builder+ only).
- `is_status_locked (int)` – Can be: 0, 1 (Admin only).

`post_revert (post_id, version_id)`

Function to reverts a post to a previous version (Requires login).

**Parameters**

- `post_id (int)` –
- `version_id (int)` – The post version id to revert to.

`post_copy_notes (post_id, other_post_id)`

Function to copy notes (requires login).

**Parameters**

- `post_id (int)` –
- `other_post_id (int)` – The id of the post to copy notes to.

`post_mark_translated (post_id, check_translation, partially_translated)`

Mark post as translated (Requires login) (UNTESTED).

If you set `check_translation` and `partially_translated` to 1 post will be tagged as ‘translated\_request’

**Parameters**

- `post_id (int)` –
- `check_translation (int)` – Can be 0, 1.
- `partially_translated (int)` – Can be 0, 1

`post_vote (post_id, score)`

Action lets you vote for a post (Requires login). Danbooru: Post votes/create.

**Parameters**

- `post_id (int)` –
- `score (str)` – Can be: up, down.

`post_unvote (post_id)`

Action lets you unvote for a post (Requires login).

**Parameters** `post_id (int)` –

`post_flag_list (creator_id=None, creator_name=None, post_id=None, reason_matches=None, is_resolved=None, category=None)`  
Function to flag a post (Requires login).

**Parameters**

- `creator_id (int)` – The user id of the flag’s creator.
- `creator_name (str)` – The name of the flag’s creator.
- `post_id (int)` – The post id if the flag.

`post_flag_show (flag_id)`  
Show specific flagged post (Requires login).

**Parameters** `flag_id (int)` –

`post_flag_create (post_id, reason)`  
Function to flag a post.

**Parameters**

- `post_id (int)` – The id of the flagged post.
- `reason (str)` – The reason of the flagging.

`post_appeals_list (creator_id=None, creator_name=None, post_id=None)`  
Function to return list of appeals (Requires login).

**Parameters**

- `creator_id (int)` – The user id of the appeal’s creator.
- `creator_name (str)` – The name of the appeal’s creator.
- `post_id (int)` – The post id if the appeal.

`post_appeals_show (appeal_id)`  
Show a specific post appeal (Requires login) (UNTESTED).

**Parameters** `appeal_id` –

`post_appeals_create (post_id, reason)`  
Function to create appeals (Requires login).

**Parameters**

- `post_id (int)` – The id of the appealed post.
- `reason (str)` –

`post_versions_list (updater_name=None, updater_id=None, post_id=None, start_id=None)`  
Get list of post versions.

**Parameters**

- `updater_name (str)` –
- `updater_id (int)` –
- `post_id (int)` –
- `start_id (int)` –

`post_versions_show (version_id)`  
Show a specific post version (UNTESTED).

Parameters **version\_id** (*int*) –

**post\_versions\_undo** (*version\_id*)

Undo post version (Requires login) (UNTESTED).

Parameters **version\_id** (*int*) –

**count\_posts** (*tags=None*)

Show the number of posts on Danbooru or a specific tag search.

Parameters **tags** (*str*) –

**upload\_list** (*uploader\_id=None, uploader\_name=None, source=None*)

Search and return an uploads list (Requires login).

Parameters

- **uploader\_id** (*int*) – The id of the uploader.
- **uploader\_name** (*str*) – The name of the uploader.
- **source** (*str*) – The source of the upload (exact string match).

**upload\_show** (*upload\_id*)

Get an upload (Requires login).

Parameters **upload\_id** (*int*) –

**upload\_create** (*tags, rating, file\_=None, source=None, parent\_id=None*)

Function to create a new upload (Requires login).

Parameters

- **tags** (*str*) –
- **rating** (*str*) – Can be: *s*, *q*, or *e*. Alternatively, you can specify *rating:safe*, *rating:questionable*, or *rating:explicit* in the tag string.
- **file** (*file\_path*) – The file data encoded as a multipart form.
- **source** (*str*) – The source URL.
- **parent\_id** (*int*) – The parent post id.

**Raises** `PybooruAPIError` – When **file\_** or **source** are empty.

**comment\_list** (*group\_by, limit=None, page=None, body\_matches=None, post\_id=None, post\_tags\_match=None, creator\_name=None, creator\_id=None, is\_deleted=None*)

Return a list of comments.

Parameters

- **limit** (*int*) – How many posts you want to retrieve.
- **page** (*int*) – The page number.
- **group\_by** – Can be ‘comment’, ‘post’. Comment will return recent comments. Post will return posts that have been recently commented on.
- **body\_matches** (*str*) – Body contains the given terms.
- **post\_id** (*int*) –
- **post\_tags\_match** (*str*) – The comment’s post’s tags match the given terms. Meta-tags not supported.
- **creator\_name** (*str*) – The name of the creator (exact match).
- **creator\_id** (*int*) – The user id of the creator.

- **is\_deleted** (*bool*) – Can be: True, False.

**Raises** `PybooruAPIError` – When ‘group\_by’ is invalid.

**comment\_create** (*post\_id, body, do\_not\_bump\_post=None*)

Action to lets you create a comment (Requires login).

**Parameters**

- **post\_id** (*int*) –
- **body** (*str*) –
- **do\_not\_bump\_post** (*bool*) – Set to 1 if you do not want the post to be bumped to the top of the comment listing.

**comment\_update** (*comment\_id, body*)

Function to update a comment (Requires login).

**Parameters**

- **comment\_id** (*int*) –
- **body** (*str*) –

**comment\_show** (*comment\_id*)

Get a specific comment.

**Parameters** **comment\_id** (*int*) – The id number of the comment to retrieve.

**comment\_delete** (*comment\_id*)

Remove a specific comment (Requires login).

**Parameters** **comment\_id** (*int*) – The id number of the comment to remove.

**comment\_undelete** (*comment\_id*)

Undelete a specific comment (Requires login) (UNTESTED).

**Parameters** **comment\_id** (*int*) –

**comment\_vote** (*comment\_id, score*)

Lets you vote for a comment (Requires login).

**Parameters**

- **comment\_id** (*int*) –
- **score** (*str*) – Can be: up, down.

**comment\_unvote** (*comment\_id*)

Lets you unvote a specific comment (Requires login).

**Parameters** **comment\_id** (*int*) –

**favorite\_list** (*user\_id=None*)

Return a list with favorite posts (Requires login).

**Parameters** **user\_id** (*int*) – Which user’s favorites to show. Defaults to your own if not specified.

**favorite\_add** (*post\_id*)

Add post to favorite (Requires login).

**Parameters** **post\_id** (*int*) – The post to favorite.

**favorite\_remove** (*post\_id*)

Remove a post from favorites (Requires login).

**Parameters** `post_id (int)` – Where `post_id` is the post id.

**dmail\_list** (`message_matches=None`, `to_name=None`, `to_id=None`, `from_name=None`,  
`from_id=None`, `read=None`)

Return list of Dmails. You can only view dmails you own (Requires login).

**Parameters**

- **message\_matches** (`str`) – The message body contains the given terms.
- **to\_name** (`str`) – The recipient’s name.
- **to\_id** (`int`) – The recipient’s user id.
- **from\_name** (`str`) – The sender’s name.
- **from\_id** (`int`) – The sender’s user id.
- **read** (`bool`) – Can be: true, false.

**dmail\_show** (`dmail_id`)

Return a specific dmail. You can only view dmails you own (Requires login).

**Parameters** `dmail_id (int)` – Where `dmail_id` is the dmail id.

**dmail\_create** (`to_name`, `title`, `body`)

Create a dmail (Requires login)

**Parameters**

- **to\_name** (`str`) – The recipient’s name.
- **title** (`str`) – The title of the message.
- **body** (`str`) – The body of the message.

**dmail\_delete** (`dmail_id`)

Delete a dmail. You can only delete dmails you own (Requires login).

**Parameters** `dmail_id (int)` – where `dmail_id` is the dmail id.

**artist\_list** (`query=None`, `artist_id=None`, `creator_name=None`, `creator_id=None`, `is_active=None`,  
`is_banned=None`, `empty_only=None`, `order=None`)

Get an artist of a list of artists.

**Parameters**

- **query** (`str`) – This field has multiple uses depending on what the query starts with:  
  - `'http:desired_url'`:  
Search for artist with this URL.
  - `'name:desired_url'`: Search for artists with the given name as their base name.
  - `'other:other_name'`: Search for artists with the given name in their other names.
  - `'group:group_name'`: Search for artists belonging to the group with the given name.
  - `'status:banned'`: Search for artists that are banned. else Search for the given name in the base name and the other names.
- **artist\_id** (`id`) – The artist id.
- **creator\_name** (`str`) – Exact creator name.
- **creator\_id** (`id`) – Artist creator id.
- **is\_active** (`bool`) – Can be: true, false

- **is\_banned** (*bool*) – Can be: true, false
- **empty\_only** (*True*) – Search for artists that have 0 posts. Can be: true
- **order** (*str*) – Can be: name, updated\_at.

**artist\_show** (*artist\_id*)  
Return a specific artist.

**Parameters** **artist\_id** (*int*) – Where artist\_id is the artist id.

**artist\_create** (*name*, *other\_names\_comma=None*, *group\_name=None*, *url\_string=None*,  
*body=None*)  
Function to create an artist (Requires login) (UNTESTED).

**Parameters**

- **name** (*str*) –
- **other\_names\_comma** (*str*) – List of alternative names for this artist, comma delimited.
- **group\_name** (*str*) – The name of the group this artist belongs to.
- **url\_string** (*str*) – List of URLs associated with this artist, whitespace or newline delimited.
- **body** (*str*) – DText that will be used to create a wiki entry at the same time.

**artist\_update** (*artist\_id*, *name=None*, *other\_names\_comma=None*, *group\_name=None*,  
*url\_string=None*, *body=None*)  
Function to update artists (Requires login) (UNTESTED).

**Parameters**

- **artist\_id** (*str*) –
- **name** (*str*) – Artist name.
- **other\_names\_comma** (*str*) – List of alternative names for this artist, comma delimited.
- **group\_name** (*str*) – The name of the group this artist belongs to.
- **url\_string** (*str*) – List of URLs associated with this artist, whitespace or newline delimited.
- **body** (*str*) – DText that will be used to create/update a wiki entry at the same time.

**artist\_delete** (*artist\_id*)  
Action to lets you delete an artist (Requires login) (UNTESTED) (Only Builder+).

**Parameters** **artist\_id** (*int*) – Where artist\_id is the artist id.

**artist\_undelete** (*artist\_id*)  
Lets you undelete artist (Requires login) (UNTESTED) (Only Builder+).

**Parameters** **artist\_id** (*int*) –

**artist\_banned** ()  
This is a shortcut for an artist listing search with name=status:banned.

**artist\_revert** (*artist\_id*, *version\_id*)  
Revert an artist (Requires login) (UNTESTED).

**Parameters**

- **artist\_id** (*int*) – The artist id.

- **version\_id** (*int*) – The artist version id to revert to.

**artist\_versions** (*name=None, updater\_name=None, updater\_id=None, artist\_id=None, is\_active=None, is\_banned=None, order=None*)

Get list of artist versions (Requires login).

#### Parameters

- **name** (*str*) –
- **updater\_name** (*str*) –
- **updater\_id** (*int*) –
- **artist\_id** (*int*) –
- **is\_active** (*bool*) – Can be: True, False.
- **is\_banned** (*bool*) – Can be: True, False.
- **order** (*str*) – Can be: name (Defaults to ID)

**artist\_commentary\_list** (*text\_matches=None, post\_id=None, post\_tags\_match=None, original\_present=None, translated\_present=None*)

list artist commentary.

#### Parameters

- **text\_matches** (*str*) –
- **post\_id** (*int*) –
- **post\_tags\_match** (*str*) – The commentary's post's tags match the giventerms. Meta-tags not supported.
- **original\_present** (*str*) – Can be: yes, no.
- **translated\_present** (*str*) – Can be: yes, no.

**artist\_commentary\_create\_update** (*post\_id, original\_title, original\_description, translated\_title, translated\_description*)

Create or update artist commentary (Requires login) (UNTESTED).

#### Parameters

- **post\_id** (*int*) – Post id.
- **original\_title** (*str*) – Original title.
- **original\_description** (*str*) – Original description.
- **translated\_title** (*str*) – Translated title.
- **translated\_description** (*str*) – Translated description.

**artist\_commentary\_revert** (*id\_, version\_id*)

Revert artist commentary (Requires login) (UNTESTED).

#### Parameters

- **id** (*int*) – The artist commentary id.
- **version\_id** (*int*) – The artist commentary version id to revert to.

**artist\_commentary\_versions** (*post\_id, updater\_id*)

Return list of artist commentary versions.

#### Parameters

- **updater\_id** (*int*) –
- **post\_id** (*int*) –

**note\_list** (*body\_matches=None, post\_id=None, post\_tags\_match=None, creator\_name=None, creator\_id=None, is\_active=None*)  
Return list of notes.

**Parameters**

- **body\_matches** (*str*) – The note’s body matches the given terms.
- **post\_id** (*int*) – A specific post.
- **post\_tags\_match** (*str*) – The note’s post’s tags match the given terms.
- **creator\_name** (*str*) – The creator’s name. Exact match.
- **creator\_id** (*int*) – The creator’s user id.
- **is\_active** (*bool*) – Can be: True, False.

**note\_show** (*note\_id*)  
Get a specific note.

**Parameters** **note\_id** (*int*) – Where note\_id is the note id.

**note\_create** (*post\_id, coor\_x, coor\_y, width, height, body*)  
Function to create a note (Requires login) (UNTESTED).

**Parameters**

- **post\_id** (*int*) –
- **coor\_x** (*int*) – The x coordinates of the note in pixels, with respect to the top-left corner of the image.
- **coor\_y** (*int*) – The y coordinates of the note in pixels, with respect to the top-left corner of the image.
- **width** (*int*) – The width of the note in pixels.
- **height** (*int*) – The height of the note in pixels.
- **body** (*str*) – The body of the note.

**note\_update** (*note\_id, coor\_x=None, coor\_y=None, width=None, height=None, body=None*)  
Function to update a note (Requires login) (UNTESTED).

**Parameters**

- **note\_id** (*int*) – Where note\_id is the note id.
- **coor\_x** (*int*) – The x coordinates of the note in pixels, with respect to the top-left corner of the image.
- **coor\_y** (*int*) – The y coordinates of the note in pixels, with respect to the top-left corner of the image.
- **width** (*int*) – The width of the note in pixels.
- **height** (*int*) – The height of the note in pixels.
- **body** (*str*) – The body of the note.

**note\_delete** (*note\_id*)  
delete a specific note (Requires login) (UNTESTED).

**Parameters** **note\_id** (*int*) – Where note\_id is the note id.

**note\_revert** (*note\_id, version\_id*)

Function to revert a specific note (Requires login) (UNTESTED).

**Parameters**

- **note\_id** (*int*) – Where note\_id is the note id.
- **version\_id** (*int*) – The note version id to revert to.

**note\_versions** (*updater\_id=None, post\_id=None, note\_id=None*)

Get list of note versions.

**Parameters**

- **updater\_id** (*int*) –
- **post\_id** (*int*) –
- **note\_id** (*int*) –

**user\_list** (*name=None, name\_matches=None, min\_level=None, max\_level=None, level=None, user\_id=None, order=None*)

Function to get a list of users or a specific user.

**Levels:** Users have a number attribute called level representing their role. The current levels are:

Member 20, Gold 30, Platinum 31, Builder 32, Contributor 33, Janitor 35, Moderator 40 and Admin 50.

**Parameters**

- **name** (*str*) – Supports patterns.
- **name\_matches** (*str*) – Same functionality as name.
- **min\_level** (*int*) – Minimum level (see section on levels).
- **max\_level** (*int*) – Maximum level (see section on levels).
- **level** (*int*) – Current level (see section on levels).
- **user\_id** (*int*) – The user id.
- **order** (*str*) – Can be: 'name', 'post\_upload\_count', 'note\_count', 'post\_update\_count', 'date'.

**user\_show** (*user\_id*)

Get a specific user.

**Parameters** **user\_id** (*int*) – Where user\_id is the user id.

**pool\_list** (*name\_matches=None, pool\_ids=None, category=None, description\_matches=None, creator\_name=None, creator\_id=None, is\_deleted=None, is\_active=None, order=None*)

Get a list of pools.

**Parameters**

- **name\_matches** (*str*) –
- **pool\_ids** (*str*) – Can search for multiple ID's at once, separated by commas.
- **description\_matches** (*str*) –
- **creator\_name** (*str*) –
- **creator\_id** (*int*) –
- **is\_active** (*bool*) – Can be: true, false.

- **is\_deleted** (*bool*) – Can be: True, False.
- **order** (*str*) – Can be: name, created\_at, post\_count, date.
- **category** (*str*) – Can be: series, collection.

**pool\_show** (*pool\_id*)

Get a specific pool.

**Parameters** **pool\_id** (*int*) – Where pool\_id is the pool id.

**pool\_create** (*name, description, category*)

Function to create a pool (Requires login) (UNTESTED).

**Parameters**

- **name** (*str*) – Pool name.
- **description** (*str*) – Pool description.
- **category** (*str*) – Can be: series, collection.

**pool\_update** (*pool\_id, name=None, description=None, post\_ids=None, is\_active=None, category=None*)

Update a pool (Requires login) (UNTESTED).

**Parameters**

- **pool\_id** (*int*) – Where pool\_id is the pool id.
- **name** (*str*) –
- **description** (*str*) –
- **post\_ids** (*str*) – List of space delimited post ids.
- **is\_active** (*int*) – Can be: 1, 0.
- **category** (*str*) – Can be: series, collection.

**pool\_delete** (*pool\_id*)

Delete a pool (Requires login) (UNTESTED) (Moderator+).

**Parameters** **pool\_id** (*int*) – Where pool\_id is the pool id.

**pool\_undelete** (*pool\_id*)

Undelete a specific pool (Requires login) (UNTESTED) (Moderator+).

**Parameters** **pool\_id** (*int*) – Where pool\_id is the pool id.

**pool\_revert** (*pool\_id, version\_id*)

Function to revert a specific pool (Requires login) (UNTESTED).

**Parameters**

- **pool\_id** (*int*) – Where pool\_id is the pool id.
- **version\_id** (*int*) –

**pool\_versions** (*updater\_id=None, updater\_name=None, pool\_id=None*)

Get list of pool versions.

**Parameters**

- **updater\_id** (*int*) –
- **updater\_name** (*str*) –
- **pool\_id** (*int*) –

**tag\_list** (*name\_matches=None, name=None, category=None, hide\_empty=None, has\_wiki=None, has\_artist=None, order=None*)

Get a list of tags.

#### Parameters

- **name\_matches** (*str*) – Can be: part or full name.
- **name** (*str*) – Allows searching for multiple tags with exact given names, separated by commas. e.g. search[name]=touhou,original,k-on! would return the three listed tags.
- **category** (*str*) – Can be: 0, 1, 3, 4 (general, artist, copyright, character respectively).
- **hide\_empty** (*str*) – Can be: yes, no. Excludes tags with 0 posts when “yes”.
- **has\_wiki** (*str*) – Can be: yes, no.
- **has\_artist** (*str*) – Can be: yes, no.
- **order** (*str*) – Can be: name, date, count.

**tag\_show** (*tag\_id*)

Show a specific tag.

Parameters **tag\_id** (*int*) –

**tag\_update** (*tag\_id, category*)

Lets you update a tag (Requires login) (UNTESTED).

#### Parameters

- **tag\_id** (*int*) –
- **category** (*str*) – Can be: 0, 1, 3, 4 (general, artist, copyright, character respectively).

**tag\_aliases** (*name\_matches=None, antecedent\_name=None, tag\_id=None*)

Get tags aliases.

#### Parameters

- **name\_matches** (*str*) – Match antecedent or consequent name.
- **antecedent\_name** (*str*) – Match antecedent name (exact match).
- **tag\_id** (*int*) – The tag alias id.

**tag\_implications** (*name\_matches=None, antecedent\_name=None, tag\_id=None*)

Get tags implications.

#### Parameters

- **name\_matches** (*str*) – Match antecedent or consequent name.
- **antecedent\_name** (*str*) – Match antecedent name (exact match).
- **tag\_id** (*int*) – Tag implication id.

**tag\_related** (*query, category=None*)

Get related tags.

#### Parameters

- **query** (*str*) – The tag to find the related tags for.
- **category** (*str*) – If specified, show only tags of a specific category. Can be: General 0, Artist 1, Copyright 3 and Character 4.

**wiki\_list** (*title=None, creator\_id=None, body\_matches=None, other\_names\_match=None, creator\_name=None, hide\_deleted=None, other\_names\_present=None, order=None*)  
Function to retrieves a list of every wiki page.

**Parameters**

- **title** (*str*) – Page title.
- **creator\_id** (*int*) – Creator id.
- **body\_matches** (*str*) – Page content.
- **other\_names\_match** (*str*) – Other names.
- **creator\_name** (*str*) – Creator name.
- **hide\_deleted** (*str*) – Can be: yes, no.
- **other\_names\_present** (*str*) – Can be: yes, no.
- **order** (*str*) – Can be: date, title.

**wiki\_show** (*wiki\_page\_id*)  
Retrieve a specific page of the wiki.

**Parameters** **wiki\_page\_id** (*int*) – Where *page\_id* is the wiki page id.

**wiki\_create** (*title, body, other\_names=None*)  
Action to lets you create a wiki page (Requires login) (UNTESTED).

**Parameters**

- **title** (*str*) – Page title.
- **body** (*str*) – Page content.
- **other\_names** (*str*) – Other names.

**wiki\_update** (*page\_id, title=None, body=None, other\_names=None, is\_locked=None, is\_deleted=None*)  
Action to lets you update a wiki page (Requires login) (UNTESTED).

**Parameters**

- **page\_id** (*int*) – Whre *page\_id* is the wiki page id.
- **title** (*str*) – Page title.
- **body** (*str*) – Page content.
- **other\_names** (*str*) – Other names.
- **is\_locked** (*int*) – Can be: 0, 1 (Builder+).
- **is\_deleted** (*int*) – Can be: 0, 1 (Builder+).

**wiki\_delete** (*page\_id*)  
Delete a specific page wiki (Requires login) (UNTESTED) (Builder+).

**Parameters** **page\_id** (*int*) –

**wiki\_revert** (*wiki\_page\_id, version\_id*)  
Revert page to a previous version (Requires login) (UNTESTED).

**Parameters**

- **wiki\_page\_id** (*int*) – Where *page\_id* is the wiki page id.
- **version\_id** (*int*) –

**wiki\_versions\_list** (*page\_id*, *updater\_id*)

Return a list of wiki page version.

**Parameters**

- **page\_id** (*int*) –
- **updater\_id** (*int*) –

**wiki\_versions\_show** (*page\_id*)

Return a specific wiki page version.

**Parameters** **page\_id** (*int*) – Where *page\_id* is the wiki page version id.

**forum\_topic\_list** (*title\_matches=None*, *title=None*, *category\_id=None*)

Function to get forum topics.

**Parameters**

- **title\_matches** (*str*) – Search body for the given terms.
- **title** (*str*) – Exact title match.
- **category\_id** (*int*) – Can be: 0, 1, 2 (General, Tags, Bugs & Features respectively).

**forum\_topic\_show** (*topic\_id*)

Retrieve a specific forum topic.

**Parameters** **topic\_id** (*int*) – Where *topic\_id* is the forum topic id.

**forum\_topic\_create** (*title*, *body*, *category=None*)

Function to create topic (Requires login) (UNTESTED).

**Parameters**

- **title** (*str*) – topic title.
- **body** (*str*) – Message of the initial post.
- **category** (*str*) – Can be: 0, 1, 2 (General, Tags, Bugs & Features respectively).

**forum\_topic\_update** (*topic\_id*, *title=None*, *category=None*)

Update a specific topic (Login Requires) (UNTESTED).

**Parameters**

- **topic\_id** (*int*) – Where *topic\_id* is the topic id.
- **title** (*str*) – Topic title.
- **category** (*str*) – Can be: 0, 1, 2 (General, Tags, Bugs & Features respectively).

**forum\_topic\_delete** (*topic\_id*)

Delete a topic (Login Requires) (Moderator+) (UNTESTED).

**Parameters** **topic\_id** (*int*) – Where *topic\_id* is the topic id.

**forum\_topic\_undelete** (*topic\_id*)

Un delete a topic (Login requires) (Moderator+) (UNTESTED).

**Parameters** **topic\_id** (*int*) – Where *topic\_id* is the topic id.

**forum\_post\_list** (*creator\_id=None*, *creator\_name=None*, *topic\_id=None*,  
*topic\_title\_matches=None*, *topic\_category\_id=None*, *body\_matches=None*)

Return a list of forum posts.

**Parameters**

- **creator\_id** (*int*) –

- **creator\_name** (*str*) –
- **topic\_id** (*int*) –
- **topic\_title\_matches** (*str*) –
- **topic\_category\_id** (*int*) – Can be: 0, 1, 2 (General, Tags, Bugs & Features respectively).
- **body\_matches** (*str*) – Can be part of the post content.

**forum\_post\_create** (*topic\_id, body*)  
Create a forum post (Requires login).

**Parameters**

- **topic\_id** (*int*) –
- **body** (*str*) – Post content.

**forum\_post\_update** (*topic\_id, body*)  
Update a specific forum post (Requires login)(Moderator+)(UNTESTED).

**Parameters**

- **post\_id** (*int*) – Forum topic id.
- **body** (*str*) – Post content.

**forum\_post\_delete** (*post\_id*)  
Delete a specific forum post (Requires login)(Moderator+)(UNTESTED).

**Parameters** **post\_id** (*int*) – Forum post id.

**forum\_post\_undelete** (*post\_id*)  
Undelete a specific forum post (Requires login)(Moderator+)(UNTESTED).

**Parameters** **post\_id** (*int*) – Forum post id.

## 1.4 Moebooru Reference

pybooru.moebooru

This module contains Moebooru class for access to API calls, authentication, build url and return JSON response.

**Classes:** Moebooru – Moebooru classes.

**class** pybooru.moebooru.**Moebooru** (*site\_name=""*, *site\_url=""*, *username=""*, *password=""*,  
*hash\_string=""*, *api\_version='1.13.0+update.3'*)

Bases: *pybooru.pybooru.\_Pybooru*, *pybooru.api\_moebooru.MoebooruApi\_Mixin*

Moebooru class (inherits: Pybooru and MoebooruApi\_Mixin).

To initialize Pybooru, you need to specify one of these two parameters: 'site\_name' or 'site\_url'. If you specify 'site\_name', Pybooru checks whether there is in the list of default sites (You can get list of sites in the 'resources' module).

To specify a site that isn't in list of default sites, you need use 'site\_url' parameter and specify url.

Some actions may require you to log in. always specify three parameters to log in: 'hash\_string', 'username' and 'password'. Default sites has an associate hash string.

**site\_name**

Get or set site name set.

**Type** str

**site\_url**

Get or set the URL of Moebooru/Danbooru based site.

**Type** str

**api\_version**

Version of Moebooru API.

**Type** str

**username**

Return user name.

**Type** str

**password**

Return password in plain text.

**Type** str

**hash\_string**

Return hash\_string of the site.

**Type** str

**last\_call**

**Type** dict

**\_\_init\_\_** (*site\_name*=", *site\_url*=", *username*=", *password*=", *hash\_string*=",  
*api\_version*='1.13.0+update.3')

Initialize Moebooru.

#### Keyword Arguments

- **site\_name** (*str*) – Get or set site name set.
- **site\_url** (*str*) – Get or set the URL of Moebooru/Danbooru based site.
- **api\_version** (*str*) – Version of Moebooru API.
- **hash\_string** (*str*) – String that is hashed (required to login). (See the API documentation of the site for more information).
- **username** (*str*) – Your username of the site (Required only for functions that modify the content).
- **password** (*str*) – Your user password in plain text (Required only for functions that modify the content).

**site\_name**

Get or set site name.

**Getter** Return site name.

**Setter** Validate and set site name.

**Type** string

**\_build\_url** (*api\_call*)

Build request url.

**Parameters** **api\_call** (*str*) – Base API Call.

**Returns** Complete url (str).

**`_build_hash_string()`**

Function for build password hash string.

**Raises**

- `PybooruError` – When isn't provide hash string.
- `PybooruError` – When aren't provide username or password.
- `PybooruError` – When Pybooru can't add password to hash string.

**`_get (api_call, params, method='GET', file_=None)`**

Function to preapre API call.

**Parameters**

- **`api_call`** (*str*) – API function to be called.
- **`params`** (*dict*) – API function parameters.
- **`method`** (*str*) – (Default: GET) HTTP method 'GET' or 'POST'
- **`file`** (*file*) – File to upload.

## 1.5 Moebooru API Reference

`pybooru.api_moebooru`

This module contains all API calls of Moebooru.

**Classes:** `MoebooruApi_Mixin` – Contains all API calls.

**class** `pybooru.api_moebooru.MoebooruApi_Mixin`

Bases: `object`

Contains all Moebooru API calls.

- API Versions: 1.13.0+update.3 and 1.13.0
- doc: <https://yande.re/help/api> or <https://konachan.com/help/api>

**`post_list (**params)`**

Get a list of posts.

**Parameters**

- **`tags`** (*str*) – The tags to search for. Any tag combination that works on the web site will work here. This includes all the meta-tags.
- **`limit`** (*int*) – How many posts you want to retrieve. There is a limit of 100:param posts per request.
- **`page`** (*int*) – The page number.

**`post_create (tags, file_=None, rating=None, source=None, rating_locked=None, note_locked=None, parent_id=None, md5=None)`**

Function to create a new post (Requires login).

There are only two mandatory fields: you need to supply the 'tags', and you need to supply the '**file\_**', either through a multipart form or through a source URL (Requires login) (UNTESTED).

**Parameters**

- **`tags`** (*str*) – A space delimited list of tags.

- **file** (*str*) – The file data encoded as a multipart form. Path of content.
- **rating** (*str*) – The rating for the post. Can be: safe, questionable, or explicit.
- **source** (*str*) – If this is a URL, Moebooru will download the file.
- **rating\_locked** (*bool*) – Set to True to prevent others from changing the rating.
- **note\_locked** (*bool*) – Set to True to prevent others from adding notes.
- **parent\_id** (*int*) – The ID of the parent post.
- **md5** (*str*) – Supply an MD5 if you want Moebooru to verify the file after uploading. If the MD5 doesn't match, the post is destroyed.

**Raises** `PybooruAPIError` – When file or source are empty.

**post\_update** (*post\_id*, *tags=None*, *file\_=None*, *rating=None*, *source=None*, *is\_rating\_locked=None*, *is\_note\_locked=None*, *parent\_id=None*)

Update a specific post.

Only the 'post\_id' parameter is required. Leave the other parameters blank if you don't want to change them (Requires login).

#### Parameters

- **post\_id** (*int*) – The id number of the post to update.
- **tags** (*str*) – A space delimited list of tags. Specify previous tags.
- **file** (*str*) – The file data ENCODED as a multipart form.
- **rating** (*str*) – The rating for the post. Can be: safe, questionable, or explicit.
- **source** (*str*) – If this is a URL, Moebooru will download the file.
- **rating\_locked** (*bool*) – Set to True to prevent others from changing the rating.
- **note\_locked** (*bool*) – Set to True to prevent others from adding notes.
- **parent\_id** (*int*) – The ID of the parent post.

**post\_destroy** (*post\_id*)

Function to destroy a specific post.

You must also be the user who uploaded the post (or you must be a moderator) (Requires Login) (UNTESTED).

**Parameters** **post\_id** (*int*) – The id number of the post to delete.

**post\_revert\_tags** (*post\_id*, *history\_id*)

Function to reverts a post to a previous set of tags (Requires login) (UNTESTED).

#### Parameters

- **post\_id** (*int*) – The post id number to update.
- **history\_id** (*int*) – The id number of the tag history.

**post\_vote** (*post\_id*, *score*)

Action lets you vote for a post (Requires login).

#### Parameters

- **post\_id** (*int*) – The post id.
- **score** (*int*) –  
– 0: No voted or Remove vote.

- 1: Good.
- 2: Great.
- 3: Favorite, add post to favorites.

**Raises** `PybooruAPIError` – When score is > 3.

**tag\_list** (*\*\*params*)

Get a list of tags.

### Parameters

- **name** (*str*) – The exact name of the tag.
- **id** (*int*) – The id number of the tag.
- **limit** (*int*) – How many tags to retrieve. Setting this to 0 will return every tag (Default value: 0).
- **page** (*int*) – The page number.
- **order** (*str*) – Can be ‘date’, ‘name’ or ‘count’.
- **after\_id** (*int*) – Return all tags that have an id number greater than this.

**tag\_update** (*name=None, tag\_type=None, is\_ambiguous=None*)

Action to lets you update tag (Requires login) (UNTESTED).

### Parameters

- **name** (*str*) – The name of the tag to update.
- **tag\_type** (*int*) –
  - General: 0.
  - artist: 1.
  - copyright: 3.
  - character: 4.
- **is\_ambiguous** (*int*) – Whether or not this tag is ambiguous. Use 1 for True and 0 for False.

**tag\_related** (*\*\*params*)

Get a list of related tags.

### Parameters

- **tags** (*str*) – The tag names to query.
- **type** (*str*) – Restrict results to this tag type. Can be general, artist, copyright, or character.

**artist\_list** (*\*\*params*)

Get a list of artists.

### Parameters

- **name** (*str*) – The name (or a fragment of the name) of the artist.
- **order** (*str*) – Can be date or name.
- **page** (*int*) – The page number.

**artist\_create** (*name, urls=None, alias=None, group=None*)

Function to create an artist (Requires login) (UNTESTED).

**Parameters**

- **name** (*str*) – The artist’s name.
- **urls** (*str*) – A list of URLs associated with the artist, whitespace delimited.
- **alias** (*str*) – The artist that this artist is an alias for. Simply enter the alias artist’s name.
- **group** (*str*) – The group or cicle that this artist is a member of. Simply:param enter the group’s name.

**artist\_update** (*artist\_id, name=None, urls=None, alias=None, group=None*)

Function to update artists (Requires Login) (UNTESTED).

Only the artist\_id parameter is required. The other parameters are optional.

**Parameters**

- **artist\_id** (*int*) – The id of thr artist to update (Type: INT).
- **name** (*str*) – The artist’s name.
- **urls** (*str*) – A list of URLs associated with the artist, whitespace delimited.
- **alias** (*str*) – The artist that this artist is an alias for. Simply enter the alias artist’s name.
- **group** (*str*) – The group or cicle that this artist is a member of. Simply enter the group’s name.

**artist\_destroy** (*artist\_id*)

Action to lets you remove artist (Requires login) (UNTESTED).

**Parameters** **artist\_id** (*int*) – The id of the artist to destroy.

**comment\_show** (*comment\_id*)

Get a specific comment.

**Parameters** **comment\_id** (*str*) – The id number of the comment to retrieve.

**comment\_create** (*post\_id, comment\_body, anonymous=None*)

Action to lets you create a comment (Requires login).

**Parameters**

- **post\_id** (*int*) – The post id number to which you are responding.
- **comment\_body** (*str*) – The body of the comment.
- **anonymous** (*int*) – Set to 1 if you want to post this comment anonymously.

**comment\_destroy** (*comment\_id*)

Remove a specific comment (Requires login).

**Parameters** **comment\_id** (*int*) – The id number of the comment to remove.

**wiki\_list** (*\*\*params*)

Function to retrieves a list of every wiki page.

**Parameters**

- **query** (*str*) – A word or phrase to search for (Default: None).
- **order** (*str*) – Can be: title, date (Default: title).
- **limit** (*int*) – The number of pages to retrieve (Default: 100).

- **page** (*int*) – The page number.

**wiki\_create** (*title, body*)

Action to lets you create a wiki page (Requires login) (UNTESTED).

**Parameters**

- **title** (*str*) – The title of the wiki page.
- **body** (*str*) – The body of the wiki page.

**wiki\_update** (*title, new\_title=None, page\_body=None*)

Action to lets you update a wiki page (Requires login) (UNTESTED).

**Parameters**

- **title** (*str*) – The title of the wiki page to update.
- **new\_title** (*str*) – The new title of the wiki page.
- **page\_body** (*str*) – The new body of the wiki page.

**wiki\_show** (*\*\*params*)

Get a specific wiki page.

**Parameters**

- **title** (*str*) – The title of the wiki page to retrieve.
- **version** (*int*) – The version of the page to retrieve.

**wiki\_destroy** (*title*)

Function to delete a specific wiki page (Requires login) (Only moderators) (UNTESTED).

**Parameters title** (*str*) – The title of the page to delete.

**wiki\_lock** (*title*)

Function to lock a specific wiki page (Requires login) (Only moderators) (UNTESTED).

**Parameters title** (*str*) – The title of the page to lock.

**wiki\_unlock** (*title*)

Function to unlock a specific wiki page (Requires login) (Only moderators) (UNTESTED).

**Parameters title** (*str*) – The title of the page to unlock.

**wiki\_revert** (*title, version*)

Function to revert a specific wiki page (Requires login) (UNTESTED).

**Parameters**

- **title** (*str*) – The title of the wiki page to update.
- **version** (*int*) – The version to revert to.

**wiki\_history** (*title*)

Get history of specific wiki page.

**Parameters title** (*str*) – The title of the wiki page to retrieve versions for.

**note\_list** (*\*\*params*)

Get note list.

**Parameters post\_id** (*int*) – The post id number to retrieve notes for.

**note\_search** (*query*)

Search specific note.

**Parameters** `query` (*str*) – A word or phrase to search for.

**note\_history** (*\*\*params*)

Get history of notes.

**Parameters**

- **post\_id** (*int*) – The post id number to retrieve note versions for.
- **id** (*int*) – The note id number to retrieve versions for.
- **limit** (*int*) – How many versions to retrieve (Default: 10).
- **page** (*int*) – The note id number to retrieve versions for.

**note\_revert** (*note\_id, version*)

Function to revert a specific note (Requires login) (UNTESTED).

**Parameters**

- **note\_id** (*int*) – The note id to update.
- **version** (*int*) – The version to revert to.

**note\_create\_update** (*post\_id=None, coor\_x=None, coor\_y=None, width=None, height=None, is\_active=None, body=None, note\_id=None*)

Function to create or update note (Requires login) (UNTESTED).

**Parameters**

- **post\_id** (*int*) – The post id number this note belongs to.
- **coor\_x** (*int*) – The X coordinate of the note.
- **coor\_y** (*int*) – The Y coordinate of the note.
- **width** (*int*) – The width of the note.
- **height** (*int*) – The height of the note.
- **is\_active** (*int*) – Whether or not the note is visible. Set to 1 for active, 0 for inactive.
- **body** (*str*) – The note message.
- **note\_id** (*int*) – If you are updating a note, this is the note id number to update.

**user\_search** (*\*\*params*)

Search users.

If you don't specify any parameters you'll \_get a listing of all users.

**Parameters**

- **id** (*int*) – The id number of the user.
- **name** (*str*) – The name of the user.

**forum\_list** (*\*\*params*)

Function to get forum posts.

If you don't specify any parameters you'll \_get a listing of all users.

**Parameters** **parent\_id** (*int*) – The parent ID number. You'll return all the responses to that forum post.

**pool\_list** (*\*\*params*)

Function to get pools.

If you don't specify any parameters you'll get a list of all pools.

**Parameters**

- **query** (*str*) – The title.
- **page** (*int*) – The page number.

**pool\_posts** (*\*\*params*)

Function to get pools posts.

If you don't specify any parameters you'll get a list of all pools.

**Parameters**

- **id** (*int*) – The pool id number.
- **page** (*int*) – The page number.

**pool\_update** (*pool\_id, name=None, is\_public=None, description=None*)

Function to update a pool (Requires login) (UNTESTED).

**Parameters**

- **pool\_id** (*int*) – The pool id number.
- **name** (*str*) – The name.
- **is\_public** (*int*) – 1 or 0, whether or not the pool is public.
- **description** (*str*) – A description of the pool.

**pool\_create** (*name, description, is\_public*)

Function to create a pool (Require login) (UNTESTED).

**Parameters**

- **name** (*str*) – The name.
- **description** (*str*) – A description of the pool.
- **is\_public** (*int*) – 1 or 0, whether or not the pool is public.

**pool\_destroy** (*pool\_id*)

Function to destroy a specific pool (Require login) (UNTESTED).

**Parameters** **pool\_id** (*int*) – The pool id number.

**pool\_add\_post** (*\*\*params*)

Function to add a post (Require login) (UNTESTED).

**Parameters**

- **pool\_id** (*int*) – The pool to add the post to.
- **post\_id** (*int*) – The post to add.

**pool\_remove\_post** (*\*\*params*)

Function to remove a post (Require login) (UNTESTED).

**Parameters**

- **pool\_id** (*int*) – The pool to remove the post to.
- **post\_id** (*int*) – The post to remove.

**favorite\_list\_users** (*post\_id*)

Function to return a list with all users who have added to favorites a specific post.

**Parameters** **post\_id** (*int*) – The post id.

## 1.6 Pybooru Reference

### 1.6.1 Pybooru

pybooru.pybooru

This module contains pybooru main class for access to API calls, authentication and return JSON response.

**Classes:** `_Pybooru` – Main pybooru class, define Pybooru object and do requests.

**class** `pybooru.pybooru._Pybooru` (*site\_name=""*, *site\_url=""*, *username=""*)

Bases: `object`

Pybooru main class.

**site\_name**

Get or set site name set.

**Type** `str`

**site\_url**

Get or set the URL of Moebooru/Danbooru based site.

**Type** `str`

**username**

Return user name.

**Type** `str`

**last\_call**

Return last call.

**Type** `dict`

**\_\_init\_\_** (*site\_name=""*, *site\_url=""*, *username=""*)

Initialize Pybooru.

**Keyword Arguments**

- **site\_name** (*str*) – The site name in ‘SITE\_LIST’, default sites.
- **site\_url** (*str*) – URL of on Moebooru/Danbooru based sites.
- **username** (*str*) – Your username of the site (Required only for functions that modify the content).

**Raises** `PybooruError` – When ‘site\_name’ and ‘site\_url’ are empty.

**site\_name**

Get or set site name.

**Getter** Return site name.

**Setter** Validate and set site name.

**Type** `string`

**\_\_weakref\_\_**

list of weak references to the object (if defined)

**site\_url**

Get or set site url.

**Getter** Return site url.

**Setter** Validate and set site url.

**Type** string

**static** `_get_status (status_code)`

Get status message for status code.

**Parameters** `status_code (int)` – HTTP status code.

**Returns** status message (str).

**\_request** (`url, api_call, request_args, method='GET'`)

Function to request and returning JSON data.

**Parameters**

- `url (str)` – Base url call.
- `api_call (str)` – API function to be called.
- `request_args (dict)` – All requests parameters.
- `method (str)` – (Default: GET) HTTP method 'GET' or 'POST'

**Raises**

- `PybooruHTTPError` – HTTP Error.
- `requests.exceptions.Timeout` – When HTTP Timeout.
- `ValueError` – When can't decode JSON response.

## 1.6.2 Exceptions

`pybooru.exceptions`

This module contains Pybooru exceptions.

**Classes:**

- `PybooruError` – Main Pybooru exception class.
- `PybooruHTTPError` – Manages HTTP status errors.
- `PybooruAPIError` – Manages all API errors.

**exception** `pybooru.exceptions.PybooruError`

Bases: `Exception`

Class to catch Pybooru error message.

`__weakref__`

list of weak references to the object (if defined)

**exception** `pybooru.exceptions.PybooruHTTPError (msg, http_code, url)`

Bases: `pybooru.exceptions.PybooruError`

Class to catch HTTP error message.

`__init__ (msg, http_code, url)`

Initialize `PybooruHTTPError`.

**Keyword Arguments**

- `msg (str)` – The error message.
- `http_code (int)` – The HTTP status code.

- **url** (*str*) – The URL.

`__str__()`

Print exception.

**exception** `pybooru.exceptions.PybooruAPIError`

Bases: `pybooru.exceptions.PybooruError`

Class to catch all API errors.

### 1.6.3 Resources

`pybooru.resources`

This module contains all resources for Pybooru.

**SITE\_LIST (dict):** Contains various Moebooru and Danbooru-based default sites.

**HTTP\_STATUS\_CODE (dict):** Contains http status codes for Moebooru and Danbooru API.
